Most Innovative Security & Safety Solutions

What we do?

Data Security

Problem

Observation

Our Solution

There are a variety of possible threats to the data you're keeping in today's environment, which is more reliant on technology.

Billions of data transmitted over the Internet need some type of data protection to prevent hackers from stealing it.

Everything from large technology firms to handheld smartphones need data security to store and transfer data.

Once hackers begin exploiting a defect in an application, security organisations attempt to mitigate the associated danger by delivering security upgrades for current software or building new applications.

In any case, hackers will be one step ahead of the data security business since no one can predict what new threats hackers will unleash.

We've discovered that data that is viewable in any kind of encryption may be hacked.

It is just a matter of time until the hacker decodes the encryption mechanism employed to conceal the data.

Historically, it has been noticed that hackers are able to decode the encryption process when data is hacked since the encrypted form is available to them.

Our aim is to provide extra layer of security in the field of encryption.

Invisible Unicode Programming (IUP) helps to transform traditional character encodings to invisible encodings.

Invisible Unicode Programming is a whitespace-based esoteric programming language whose primary goal is to hide the data which can only be decrypted using our platform.

Historical Background

01

Earlier Attempts in Obfuscating

Whitespace is an esoteric programming language developed by Edwin Brady and Chris Morris at the University of Durham in 2003. The basic idea was to use 3 Non-Visible Characters (Tab, Space and Line Feed) in the Programming and leave all other Visible Characters. Unfortunately, no important Application could be developed at that time.

02

Steganography

Steganography is the practice of concealing a message within another message or a physical object. In Computing/ electronic contexts, a computer file, message, image or video is concealed within another file, message or video. This technique is being used by a few companies these days which help the Data to be Hidden in the Obfuscating Form. It has its own limitations and can only hide the Data within another files.

Invisible Unicode Programming

With the constant use of web and other online services, it has become clear that copying, distributing, and transferring digital files over the Internet is a cinch. Since text is one of the most important available data sources and the most extensively used digital media on the Internet, it makes up a large portion of websites, books, articles, daily newspapers, and so on.

Currently, the IUP approach is used to protect the privacy and uniqueness of HTML source code. As a result, Invisible Unicode Programming regards it as a difficult task to specify a tenuous alteration in HTML Source coding. The invisible character approach is used to conceal html source code so that no one can see the concealed processing.

»» To know more about IUP, please go through the research journal published on International Journal of Research Publication and Reviews. [Link](#)

How IUP Works?

- » Unicode Programming (IUP) helps to transform traditional character encodings to invisible encodings.
- » To hide and extract hidden information, this approach use the binary format of invisible characters. The process of creating a secret message consists of four major steps:
 1. First, using the binary format of the original letters in the message
 2. Creating the appropriate Binary Masking Value (BMV) to cover the text
 3. Subtracting the Binary Value (BV) from the Binary Masking Value (BMV) text to get Binary Invisible Unicode (BIU)
 4. Finally masking secret text using Binary Invisible Character (BIU).
- » The 54 Invisible Unicode characters are used in this Invisible Unicode Programming (IUP) Concept to make the text invisible.
- » Experiment findings reveal that this IUP approach generates extremely safe invisible information utilising a multi-level complexity algorithm to evade hackers.

What INVIDATA's IUP can do?

Privacy and Confidentiality

Strong File Encryption Algorithm

INVIDATA's INVISIBLE Unicode Programming (IUP) is a revolutionary file encryption software that allows you to not only encrypt file and folder structures that contain confidential data but it also offers you the **possibility to hide files, making it completely invisible to any user**. Encrypt file contents and hide files using INVIDATA, a complete solution for Privacy and Confidentiality.

Invidata is a file encryption software that helps you protect your confidential information from prying eyes or unwanted access by helping you encrypt file or folder structures on your computer. **Featuring strong file encryption algorithms**, it ensures you the maximum security level you need for complete privacy protection.

What INVIDATA's IUP can do?

Completely Invisible Files

Invidata helps you protect your confidentiality and prevent data breaches by safely encrypting and hiding selected data files for safe storage or secure transfer over the Internet. It will help you hide files or confidential information you don't want others to know exist on your computer by **disguising it into completely INVISIBLE files**.

Invisible Layer to Metadata of a file

Invisible layer to metadata of the file makes zero byte files, which become a non Accessible remotely. Zero Byte file size ensures that it not remotely accessible by any hacker.

This is our most unique and powerful technique to make invisible layer to metadata.

Who can Benefit?

- » Practically all organisations and consumers that want to protect themselves from scammers/hackers and guarantee that their text communication is secure and only reaches the authorised recipients.

Invidata – Tools and Products

01

Unique Data Security

Hide your important data, files, excel sheets,
Images in Invisible Format

02

VVIPs Technology

Unique way of communicating in
Invisible Language

03

Owl Technology

Owner's Watermark License

***In first Phase, we are focusing on Unique Data Security**

Unique Data Security

Invidata introduces Unique Data Security, which uses IUP technology and is the outcome of cutting-edge Cyber Security research. We focus on developing new solutions to combat sophisticated fraudsters and hackers that copy/clone organisations' digital identities and personal data. After researching their operating procedures, Meticulous and Foolproof Solutions were devised. We are focusing on several areas, particularly front-end security, which is insufficient and highly susceptible.

Customise **D**ata **S**ecurity

Unique Solutions from Invidata

We have created a self service model for accessing INVIDATA security, where user can;

- Convert any file, whether audio, video, image, text, pdf, word, excel, ppt or any other format to Invisible Text File.
- Can control access levels for higher security.
- Can make the file ZERO byte for added security.

Invidata operates both online and offline through our website and desktop application.

Invidata Website

Invidata Desktop Application

Encryption/Decryption Process

1. Login Using your Website Credentials

2. Choose Encryption/Decryption Process

4. Your encrypted/Decrypted file is ready to download

3. Upload Your file

Our Team

Dr. Dilip Rai
